Yellow spring bedstraw

© Jamie Fenneman (Photo ID #10170) Click to enlarge and view the details of the photo View all photos for this taxon Distribution of Galium verum Click here to view our interactive map and the legend Details on the map content are available hereClick on the map points to view record details. General: Perennial herb from a creeping rhizome; erect decumbent stems, different, ramified, finely hairy, at least in inflorescence, 25-120 cm tall/long. Leaves: Basque leaves are missing; stele leaves in whorls of 6-8, sometimes up to 12, strictly linear with margins rolled under, 1-veined, the tips with rigid points, finely hairy, of 1-3 cm of length, not shaved. Flowers: Inflorescence a terminal, leafy, panic composed of numerous flowers in the shape of corollas, bright yellow, 4-lobed, 2-4 mm wide. Fruits: Nutlets, 2, 1-1.5 mm long, smooth. Source: The illustrated Flora of the British Columbia Ecological Framework for the Verum of Galium The following table shows the specific information of the species calculated from the original data (BEC base) provided by the BC Ministry of the forests and of the range.(Updated August, 2013) Information value of the site / Average Minimum Class Maximum elevation (metre) 785 785 785 Grade of gradient (%) 5 Aspect (grades) [MR0 180 - N 4 - months; 8 - water) 4 4 4 4 Modal Nutrient Regime Class C Number of field plots species has been recorded in: 1 Modal BEC Zone Class BWBS All BEC zones (# stations/zone) species has been registered in: BWBS(1) Page 2 Photo © Jamie Fenneman (Photo ID #10170) See all photos for this taxon. If more than one illustration is available for a species (for example, separate illustrations for two subspecies were provided) then the links to separate images will be provided below. Note that individual subspecies or varietal illustrations are not always available. Source of illustration: The illustrated Flora of the British Columbia Ecological Framework for the Verum of Galium The following table shows the specific information of the species calculated from the original data (BEC base) provided by the BC Ministry of the forests and of the range.(Updated August, 2013) Information value on the site / Class Avg Min Max Elevation (metres) 785 785 785 Gradiente gradiente (%) 5 5 5 Aspect (grades) [MR0 180 - N 4 - months; 8 - water) 4 4 4 4 Modal nutrient Class Regime C # of the species of field batches was recorded in: 1 Modal BEC Zone Class BWBS All BEC Zone species (# of stations/zone) have been recorded in BWBS(1) Plant species Galium verum Clade plantae: Tracheophytes Clade: Angiosperms Clade: Eudicots Clade: Asterids Order: Gentianales Family: Rubiaceae Genre: GaliumG. verum Binomium name Galium verum L. The yellow cinta (Sánziana galbenă) from the spontaneous flora of the Transylvanian plateau Galium verum (lastra di lady[1] or the yellow cinta) is a perennial herbaceous plant of the del del del del del del del del del delRubiaceae. It is widespread throughout most of Europe, North Africa, and Asia temperate from Palestine, Lebanon and Turkey to Japan and Kamchatka. It is naturalized in Tasmania, New Zealand, Canada, and the northern half of the United States. It is considered a harmful grass in some places. [2][3][4] Galium verum is a low scrambling plant, with stems growing at 60–120 cm (24–47 in) long, often rooting where they touch the ground. The leaves are 1 to 3 cm long (0.39-1.8 inches) and 2 mm long (0.079 in) wide, glossy dark green, hairy under, had in kilograms of 8-12. The flowers are from 2 to 3 mm (0.079-0.118 in) of diameter, yellow and produced in dense clusters. This species is sometimes confused with Galium odoratum, a species with traditional culinary uses. [5] In medieval Europe, dry plants were used to fill mattresses,[6] as the scent of coumarin of plants acts as a flea reactor. The flowers were also used to coagulate milk in the production of cheese (which gives the plant its name, from the Greek word γάλα, gala ' milk) and, in Gloucestershire, to color the double cheese Gloucester. [7] The plant is also used to produce red dyes similar to madder and yellow. In Denmark, the plant (known locally as gul snorre) is traditionally used to instill spirits, making the unique Danish drink bjæsk [da]. Frigg mythology was the goddess of married women, in Norse mythology. He helped women to give birth to children, and as Scandinavians used the plant's cinta (Galium verum) as a sedative, they called it Frigg's herb. [8] In Romanian folklore, it is called sánziana and is linked to the fairies of Sânziene and their festival on June 24. In Gaelic mythology, the hero Cú Chulainn, who suffered the clothing of anger during the battle, would take a tea of this plant to calm his frenzy. [citation required] The plant is known as lus chneas Chù-Chulainn 'the skin herb of Cù Chulainn' in Scottish Gaelic,[9] and in the XIV/15th century occurred with the Irish name Bolad cneise with Culainn 'the smell of the skin of Cù Chulainn' (NLI G 11 182b2). Many varietal and subspecific names have been proposed, but only four are currently (May 2014) recognized: [2] Galium verum subsp. asiaticum (Nakai) T.Yamaz - China, Korea, Japan, Far Russian East (Primorye) Galium verum subsp. glabrescens Ehrend. - Iran, Iraq, Turkey, Syria Galium verum subsp. verum - most species range Galium verum subsp. wirtgeni (F.W.Schultz) Oborny - Central and Eastern Europe plus Western Siberia Gallery Seedling See also List of Lepidoptera which feed on references of Galium ^ BSBI List 2007 (xls).
