Frigidaire gallery refrigerator repair manual

Skip to main content Home & Components Refrigerator Appliances Here is how to fix a refrigerator that fails that lost its feeling of frost. This step-by-step guide will show you how to identify the problem and possibly even solve it yourself. Although repair requires a professional, you will be able to show them the problem so save time and money. Fan and/or condenser fan There are several possible causes when a refrigerator does not keep your cold milk or your frozen ice cream. Before attempting more complex repairs, try these simple fixes if the refrigerator is not cooling and if the freezer does not work: Make sure the refrigerator is connected and get power. The light should come when the door opens. Check the thermostat to make sure it was not mistaken. If your cold/freezer thermostat doesn't work, you get these thermostats easy to install on Amazon. Make sure the mouths on the back of the freezer are not blocked by frozen ice cream boxes or vegetables — the mouths must be clear for cold air to circulate. Suction the coils under or behind the refrigerator. Inlaid coils can cause poor cooling. Check to make sure nothing is stuck in the condenser fan and turns freely (the models with coils on the back will not have a fan). To do this, unplug the refrigerator and pull it out. Clean fan blades and turn the fan to see if it is stuck. Connect the refrigerator and make sure the fan works when the compressor is running. If the fan is not executed, see the directions below, which show how to replace it. In this video, we will show you some additional tips to solve refrigerator problems: Replace the Evaporator FanHere refrigerator are some tips for troubleshooting the refrigerator to help zero on the problem if you notice the non-cooling refrigerator. If you can feel the compressor running, but the refrigerator is not cooling, the problem is most likely to be the inlaid evaporator coils or a blower blocked or broken evaporator. Evaporator fans often squeal or chirp when they start to go wrong. You will be that it is the evaporator fan if the noise becomes stronger when opening the freezer door. The coils and evaporators are behind a cover in the freezer compartment Buy a evaporator fan kit on Amazon. If you remove the cover inside the freezer and you find the reels completely filled with frost, take everything from the freezer and the refrigerator, unplug and let it thaw for 24 to 48 hours. Keep some towels at your fingertips for water soaking that can leak on the floor. When all the frost is dissolved, connectrefrigerator. If it works, the problem may be a defrost timer, defrost heater or defrost thermostat. Replacing these parts is not difficult, but understanding that it is defective requires solving problems which we will not cover here. Call a pro if you suspect a problem with these parts.
