Android butterknife example.

Heads up: Development on this tool is winding down as view binding is stable in AS/AGP 3.6+. Fix: Support receiving MotionEvent in an @OnTouch callback when using 'butterknife-reflect'. Version 10.2.2 (2020-08-03) Heads up: Development on this tool is winding down as view binding is stable in AS/AGP 3.6+. Fix: Views detached while processing click callbacks will no longer disable future clicks on other views. Version 10.2.1 (2019-12-19) Heads up: Development on this tool is winding down as view binding will be stable in AS/AGP 3.6. New: Make R2-generating Gradle task cacheable by default. Fix: R2 classes now generate their own unique values for entries. This ensures that the annotation processor can always do a reverse mapping from ID back to name and type. In AGP 3.6.0, the R.txt symbol table that was previously used as a source for values now uses 0 for every entry which required this change. Fix: Lint check for R2 values now properly handles static imports for entries. Version 10.2.0 (2019-09-12) New: Support incremental annotation processing. Fix: Detect generated superclass bindings across compilation units. Fix: Avoid deprecated APIs from the Android Gradle plugin. As a result, the new minimum supported version of the Android Gradle plugin is 3.3. Version 10.1.0 (2019-02-13) New: Listeners which require return values (e.g., long click) can now be bound to methods returning void. The default value of true will be returned in this case. New: Add support for @OnTextChanged and @OnPageChange to reflection backend. Remove enforcement of required views in the reflection backend. Most @Nullable annotations do not have runtime retention so they can't be checked at runtime with reflection. Instead of forcing everyone to find a new annotation, this enforcement is now dropped. While this might lead to nulls in otherwise required view bindings, they'll either be unused or quickly cause a NullPointerException. Version 10.0.0 (2019-01-03) Equivalent to 9.0.0 but only supports AndroidX-enabled builds. Removed APIs deprecated in 9.0.0. Version 9.0.0 (2019-01-03) New: Support for AndroidX. Requires android.useAndroidX=true in gradle.properties to generate AndroidX code. New: A butterknife-runtime artifact has been extracted from butterknife which contains the APIs required for the generated code but does not contain the code to reflectively look up the generated code. This allows you to reference the generated code directly such that R8/ProGuard optimization can rename both the generated code and your classes. ButterKnife.bind and the consumer R8/ProGuard rules remain in the old butterknife artifact. New: Experimental butterknife-reflect artifact eliminates the need to run the annotation processor for IDE builds. This artifact is binary compatible with butterknife so it can be interchanged depending on how your build is being invoked. See its README for more information. Currently about 90% of functionality is covered. File bugs for anything that does not work. Note: This artifact requires Java 8. There's no good reason for this except to push the ecosystem to having this as a default. As of AGP 3.2 there is no reason not to do this. New: Lint checks have been ported to UAST and now work on Kotlin code. Fix: Allow @BindFont to work prior to API 26 using ResourcesCompat. Add support for Android Gradle plugin 3.3 and newer where R is no longer generated as Java source. This has a side-effect of removing support for Android Gradle plugin 3.0.x (and older). Use Java 8 bytecode for all artifacts as announced in RC1 release notes. Fix: Allow @BindFont to work prior to API 26 using ResourcesCompat. Fix: Update Android Gradle plugin to 3.1 or newer to fix binary incompatibilities. Fix: Correct generated resource annotation names when running Turkish locale. Fix: Use the application ID instead of the resource package for generating R2. Cache the fact that a class hierarchy has no remaining bindings to prevent traversing the hierarchy multiple times. Deprecated methods from 8.x have been removed. Version 9.0.0-rc3 (2018-12-20) Fix: Correct generated resource annotation names when running Turkish locale. This reduces the amount of generated code for release builds at the expense of less friendly exceptions when something breaks. Deprecate the findbyId methods. Compile against API 26 and use the normal findViewByid for the same functionality. Fix: Correct @BindFont code generation on pre-API 26 builds to pass a Context (not a Resources) to ResourceCompat. Version 8.7.0 (2017-07-07) New: @BindFont annotation binds Typeface instances with an optional style. Requires support libraries 26.0.0-beta1 or newer. New: @BindAnim annotation binds Animation instances. New: Generate R2 constants for animation, layout, menu, plurals, styles, and stylesables. Fix: Properly catch and re-throw type cast exceptions when method binding arguments do not match. Version 8.6.0 (2017-05-16) Plugin was ported to Kotlin and updated to support future Android Gradle plugin versions. Fix: Properly handle multiple library modules using Butter Knife and defining the same ID. Fix: Use the same classloader of the binding target to load the generated view binding class. Version 8.5.1 (2017-01-24) Fix: Tweak bundled ProGuard rules to only retain the two-argument constructor accessed via reflection. Version 8.5.0 (2017-01-23) Emit @SuppressLint when @OnTouch to avoid a lint warning. Migrate lint checks from Lombok AST to JetBrains PSI. Annotations are no longer claimed by the processor. Based on the minimum SDK version (as specified by butterknife.minSdk until it's released) the generated code now changes to use newer APIs when available. Generated classes now include single-argument overloads for View, Activity, and Dialog subclasses. Generated classes are no longer generic. Minimum supported SDK is now 9. Version 8.4.0 (2016-08-26) New: @BindFloat annotation for dimensions whose format is of type 'float'. See the annotation for more information. Generated constructors are now annotated with @UIThread and non-final, base classes (bind) methods are annotated with @CallSuper. Version 8.3.0 (2016-08-23) New: Support for Jack compiler in application projects. Fix: Generate ~20% less code and ~40% less methods. Fix: Allow @BindView to reference types which are generated by other annotation processors. Experimental: The generated view binding class can now be used directly. This allows ProGuard shrinking, optimization, and obfuscation to work without any rules being needed. For a class Test, the binding class will be named Test_ViewBinding. Calling its constructor will bind the instance passed in, and the create object is also the implementation of Unbinder that can be used to unbind the views. Note: The API of this generated code is subject to backwards-incompatible changes until v9.0. Version 8.2.1 (2017-08-09) Fix: Properly emit casts for single-bound view subtypes when butterknife.debuggable is set to false. Version 8.8.0 (2017-08-04) New: Processor option butterknife.debuggable controls whether debug information is generated. When specified as false, checks for required views being non-null are elided and casts are no longer guarded with user-friendly error messages. This reduces the amount of generated code for release builds at the expense of less friendly exceptions when something breaks. Deprecate the findbyId methods. Compile against API 26 and use the normal findViewByid for the same functionality. Fix: Correct @BindFont code generation on pre-API 26 builds to pass a Context (not a Resources) to ResourceCompat. Version 8.7.0 (2017-07-07) New: @BindFont annotation binds Typeface instances with an optional style. Requires support libraries 26.0.0-beta1 or newer. New: @BindAnim annotation binds Animation instances. New: Generate R2 constants for animation, layout, menu, plurals, styles, and stylesables. Fix: Properly catch and re-throw type cast exceptions when method binding arguments do not match. Version 8.6.0 (2017-05-16) Plugin was ported to Kotlin and updated to support future Android Gradle plugin versions. Fix: Properly handle multiple library modules using Butter Knife and defining the same ID. Fix: Use the same classloader of the binding target to load the generated view binding class. Version 8.5.1 (2017-01-24) Fix: Tweak bundled ProGuard rules to only retain the two-argument constructor accessed via reflection. Version 8.5.0 (2017-01-23) Emit @SuppressLint when @OnTouch to avoid a lint warning. Migrate lint checks from Lombok AST to JetBrains PSI. Annotations are no longer claimed by the processor. Based on the minimum SDK version (as specified by butterknife.minSdk until it's released) the generated code now changes to use newer APIs when available. Generated classes now include single-argument overloads for View, Activity, and Dialog subclasses. Generated classes are no longer generic. Minimum supported SDK is now 9. Version 8.4.0 (2016-08-26) New: @BindFloat annotation for dimensions whose format is of type 'float'. See the annotation for more information. Generated constructors are now annotated with @UIThread and non-final, base classes (bind) methods are annotated with @CallSuper. Version 8.3.0 (2016-08-23) New: Support for Jack compiler in application projects. Fix: Generate ~20% less code and ~40% less methods. Fix: Allow @BindView to reference types which are generated by other annotation processors. Experimental: The generated view binding class can now be used directly. This allows ProGuard shrinking, optimization, and obfuscation to work without any rules being needed. For a class Test, the binding class will be named Test_ViewBinding. Calling its constructor will bind the instance passed in, and the create object is also the implementation of Unbinder that can be used to unbind the views. Note: The API of this generated code is subject to backwards-incompatible changes until v9.0. Version 8.2.1 (2017-08-09) Fix: Properly emit casts for single-bound view subtypes when butterknife.debuggable is set to false. Version 8.8.0 (2017-08-04) New: Processor option butterknife.debuggable controls whether debug information is generated. When specified as false, checks for required views being non-null are elided and casts are no longer guarded with user-friendly error messages. This reduces the amount of generated code for release builds at the expense of less friendly exceptions when something breaks. Deprecate the findbyId methods. Compile against API 26 and use the normal findViewByid for the same functionality. Fix: Correct @BindFont code generation on pre-API 26 builds to pass a Context (not a Resources) to ResourceCompat.
